Source-bound non-execution stage classification

2026-10-22; crypto-autoresearcher audit branch

Gate result. The full ledger validator still exits 1. Unsuppressed messages fell from **147 in 41 paths** to **142 in 40 paths**. The exact five removed messages concern missing process-capture files for the QSP Stage 0 hand derivation; there are zero added errors and one new advisory. The prune-only baseline was not expanded. Counts are schema messages, not scientific conclusions.

Error class	Before	After
Prior-art metadata	66	66
Review/handoff fields	32	32
Citation provenance	23	23
Run-manifest schema	19	19
Broken references	1	1
Zero-compute stage artifacts	5	0
Experiment-spec fields	1	1
Total	147	142

Admitted category. The frozen experiment specification says Stage 0 runs no program; the superseding manifest declares none occurred and names a hand derivation note. Registry admission binds the original and superseding manifest, specification, and note by SHA-256. It requires the exact stage, status, command, certificate, and five declared absences. No archived source or run artifact was changed or fabricated.

Negative controls. The 87 run-supersession tests pass. Modified source hashes, stage/status/execution fields, and an unexpected captured command reject admission. An unregistered terminal record still owes all five files. A rejected registered declaration remains a forced error. Stage 5, whose report program did run, retains the ordinary capture contract.

Scope. The category credits no measurement and proves no QSP identity, finite-field bound, or attack result. The other 142 ledger errors, 24 historical reader parse warnings, and stale public Pages snapshot remain open. The Markdown report, exact delta JSON, source-binding receipt, SVG and full validator log contain the reproducible evidence.
