Prym width16: checked finite observations

DEC-20261026-83e304 accepts the recorded observations and the new prospective review round within their tested scope. EXP-ECDLP-a9b6a5 completed its observation-only contract. Hypothesis H-ECDLP-51f052 and GOAL-ECDLP-001 retain their existing states; no broader mathematical or performance claim is promoted.

RUN-ECDLP-967315 and archived RUN-ECDLP-ea49a6; 64 public sources/cell. m16: 2,293,760 new attempts/cell; m8: 229,376 historical attempts/cell. Exact finite counts; cases selected after known m8 zero rows. Different workloads/times: no performance comparison.

Observation

RUN-ECDLP-967315 executed exactly 4,587,520 new m16 descriptors on the two fixed p=4099, A=2, B=13/16 cases, using the same 64 public sources and original 8 prefix. Each case completed 2,293,760 attempts. B13 recorded 97 accepted rows, affine/augmented rank 13, U=15 and nullity 2. B16 recorded 67 rows, affine/augmented rank 9, U=15 and nullity 6. These are measured finite counts; nullity is also U-rank. The contract required complete valid observations, not a favorable rank.

The archived m8 reference supplies 229,376 attempts/case, zero rows, rank 0, U=7, nullity 7. No new m8 scientific trial ran. The fresh reviewer validation-replayed those 458,752 historical descriptors separately from the 4,587,520 new-stream statuses.

Comparison and checks

The two cases were selected after their known m8 zero-row outcomes. Increasing width changes descriptor support and unknown columns together. The reference was executed at a different time; these data support a finite support comparison, not a matched performance benchmark.

The native checker replayed the full stream. A fresh independent session then reproduced all 4,587,520 statuses and 128 source commitments with its own arithmetic. All 164 principal/E1/E2/transported witnesses, matrices, ranks, kernels and source checkpoints matched. A p101 positive/prefix-alias control passed; 19 mathematical false copies and 4 false pointer copies were rejected. The reviewer checked 73 native source/input bindings and 20 export file bindings.

The public derivation was generated 06:30:40.398622Z after its last phase1 read. The Coordinator seal at 06:31:39.053124Z was committed in6711ff3 before the later06:33:33.695485Z release. The complete timeline contains 343 events, 341 reads and 186 source files. Root independently ran the exact --no-addenda gate and protocol-review validation after reviewer quiescence; both returned 0. The later 16-unit nonce audit is separately recorded; the earlier exhaustive replay was not relabelled as nonce-selected.

Inference and limits

The observation-completion criterion is met. Neither case has full base rank in this stream. Rank deficiency alone does not make a collector useless or rule out a particular target functional: for consistent Mz=b, a future v·z is determined by these equations exactly when v annihilates kerM, equivalently v lies in rowspace M. This run contains no target Q or descent evidence, so that criterion remains prospective.

The reviewer checked local cached stored/logical bytes and made no fresh remote GET. Actual producer canonical Put/Get/readback is separate custody evidence. Primitive counters were not independently instrumented; pow internals, Python bookkeeping, byte movement and complete weighted S remain excluded. Clocks are diagnostic. There is no ECDLP speedup, security, general rank obstruction or prescribed-execution-proof claim.

The historical TASK-20261025-5145ac formal failure remains unchanged. The new gate passes only this prospectively sealed round and checks declared content/chronology, not absence of undisclosed reads or actor authentication. Same-session inference capacity interruptions did not restart the scientific trial or change its parameters.

Provenance and next action

Actual execution authority/source is 9b101900b8b5c0450d7aaa4f5b5131e40bede87f. Native21 outputs were published f949eeb; the separate run report 9142393; native content_at_commit snapshot 260f23a; prospective review activation 9185cc6; blind archive 6711ff3; explicit release 7c7ce0d. Frozen 56-source/15-input manifest plus its own file and protocol remain bound to that historical execution, never rebound after data. Later main integration is a separate control-plane operation; no current-main replay-admission compatibility is inferred.

Coordinator next: retain these observations, then rank residual-kernel/constructor diagnosis and a separately frozen target-row span question if useful. No new scientific experiment is authorized here. Canonical prior scientific graphs were checked by artifact hashes and retain their historical meaning; this dated report adds its own chart. Neutral daily metrics add 8 actual committed width gauges; 10 focused tests pass.

Evidence: experiments/EXP-ECDLP-a9b6a5/reviews/TASK-20261025-2fe077/report.json; coordination/goals/GOAL-ECDLP-001/batches/BATCH-49720f/final/review-gates.json; experiments/EXP-ECDLP-a9b6a5/export-analysis.json; experiments/EXP-ECDLP-a9b6a5/runs/RUN-ECDLP-967315/verification.json. Decision:DEC-20261026-83e304; review:TASK-20261025-2fe077; archive:TASK-20261025-6538df.

PR 2560 final-head CI/main integration remain separate. Automatic approval review rejected enabling auto-merge for lack of recognized specific protected-main authorization; no retry or bypass is authorized by this decision.
