Native worksheet execution: EXP-ECDLP-4a3f03

Descriptive finite worksheet observations only; no hypothesis verdict, asymptotic claim or deployed-curve result.

Hypothesis H-ECDLP-91699d; goal GOAL-ECDLP-001. Requested 2 trials.

Run — Native status — Driver wall seconds — CPU seconds — RSS bytes
RUN-ECDLP-030f1f — output_validated — 3.636633431999144 — 1.443031 — 55087104
RUN-ECDLP-4b5355 — output_validated — 3.125591876998442 — 1.232926 — 55087104

All values are recorded unless expressly labeled derived. Native elapsed is derived as finished_at minus started_at. Driver wall/CPU/RSS use each manifest's explicit boundaries, retained in report-data.json; RSS is a lifetime per-process peak, not aggregate memory. These deterministic route observations have one datum each, no sampled uncertainty or performance inference. No random draw is introduced; null seed and curve_id remain as recorded. A finite worksheet witness is not a formal, decomposition or discrete-log certificate.

Canonical graph scope checked: knowledge/frontiers/ecdlp and the frozen specification. These finite records do not change a scientific status or graph. The pipeline diagram records what ran; the timing plot, where present, plots recorded driver intervals only and claims no speedup.

Complete commands, controls, parameters, code/dirty/environment identities, exact source hashes and raw publication commits are retained in report-data.json and the linked raw runs. Missing data remain null. No result of a control gate is promoted to a hypothesis verdict.

Recorded scalar metrics

Structured fields are retained completely in report-data.json and report.md; no truncation or numerical inference changes the raw evidence.
