Native worksheet execution: EXP-ECDLP-65f903

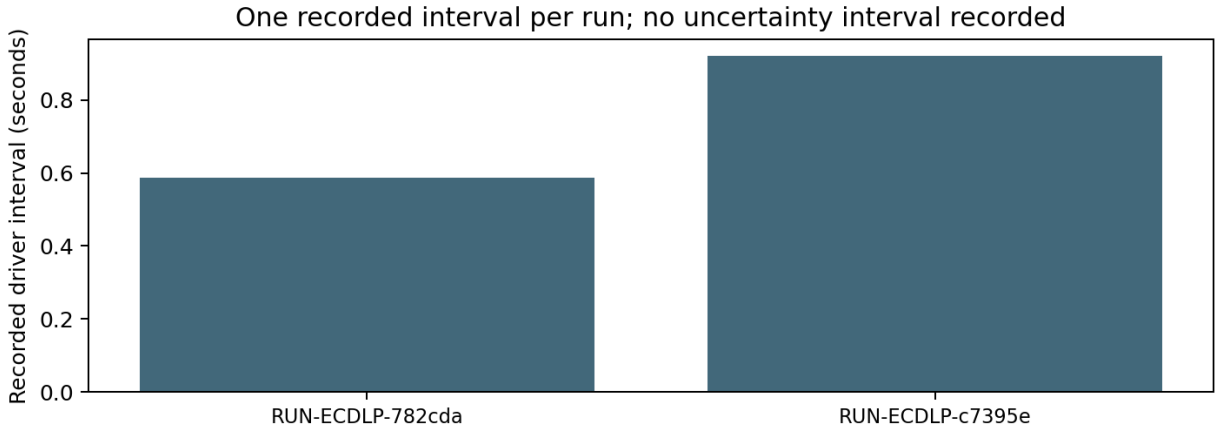

Descriptive finite worksheet observations only; no hypothesis verdict, asymptotic claim or deployed-curve result.

Hypothesis H-ECDLP-5b76e2; goal GOAL-ECDLP-001. Requested 2 trials.

Run — Native status — Driver wall seconds — CPU seconds — RSS bytes (floating values displayed to 6 significant digits; full precision retained in report-data.json)
RUN-ECDLP-782cda — output_validated — 0.588009 — 0.587571 — 55107584
RUN-ECDLP-c7395e — output_validated — 0.919853 — 0.919858 — 55107584

All values are recorded unless expressly labeled derived. Native elapsed is derived as finished_at minus started_at. Driver wall/CPU/RSS use each manifest's explicit boundaries, retained in report-data.json; RSS is a lifetime per-process peak, not aggregate memory. These deterministic route observations have one datum each, no sampled uncertainty or performance inference. No random draw is introduced; null seed and curve_id remain as recorded. A finite worksheet witness is not a formal, decomposition or discrete-log certificate.

Canonical graph scope checked: knowledge/frontiers/ecdlp and the frozen specification. These finite records do not change a scientific status or graph. The pipeline diagram records what ran; the timing plot, where present, plots recorded driver intervals only and claims no speedup.

Complete commands, controls, parameters, code/dirty/environment identities, exact source hashes and raw publication commits are retained in report-data.json and the linked raw runs. Missing data remain null. No result of a control gate is promoted to a hypothesis verdict.

Recorded scalar metrics

```

Structured fields are retained completely in report-data.json and report.md; no truncation or numerical inference changes the raw evidence.
