Source-bound ledger triage

2026-10-22; crypto-autoresearcher audit branch

Gate result. The complete-tree ledger validator still exits 1. Unsuppressed messages fell from **162 in 49 paths** to **157 in 47 paths**. The delta consists of exactly five removed lines and no new lines; the prune-only baseline was not expanded. Counts are validator messages, not scientific conclusions.

Error class	Original	Corrected
Prior-art metadata	66	66
Review/handoff fields	32	32
Citation provenance	28	28
Run-manifest schema	19	19
Broken references	7	6
Zero-compute stage artifacts	5	5
Experiment-spec fields	5	1
Total	162	157

Source corrections. The frozen approved ECDLP toy specification already states its O-FLOOR and O-EXCESS thresholds. A hash-pinned complete replacement adds only three schema fields: singular success and falsification criteria and decision impact. The original specification and trial-plan binding remain byte-identical. A QSP evidence replacement removes one expired attempt from structured run IDs. That attempt has only a claim-expired execution receipt, no run manifest, no raw result, and no scientific conclusion. The replacement still cites the receipt and describes the failed attempt. Source checks and 11 schema-supersession unit tests pass.

Open integrity gaps. The QSP Stage 0 hand derivation ran no program. Its five missing command/output artifacts remain honestly reported; a non-execution category needs a scoped validator rule and negative controls. An internal Frobenius citation treats a no-solving-degree-drop prediction as established; its attribution and named-reader provenance remain open. The ledger gate still has 157 errors, and the reader still reports 24 unparseable historical originals, 15 without registered replacements.

Dashboard boundary. No new timing or benchmark datum was produced, so no numerical performance graph changed. The earlier local reader build matched all nine primary benchmark rows. The public Pages workflow was manually disabled at the last status check; this report does not claim a hosted refresh. The accompanying Markdown report, SVG, counts JSON, full validator log, and source-check receipt contain the exact evidence.
