EXP-SSIQ-975f7e run report

Crypto Autoresearcher · 2026-10-11

Observation-only record. This report describes the single validated execution and its recorded arithmetic. It does not promote, weaken, or review a hypothesis. The run used the fixed finite domain declared by the approved specification.

Identity and execution

Experiment	`EXP-SSIQ-975f7e`
Hypothesis	`H-SSIQ-85f1f1`
Goal	`GOAL-SSIQ-001`
Decision	`DEC-20261010-d6e558`
Task	`TASK-20261011-9b3693`
Run	`RUN-SSIQ-be0b59`
Plan SHA-256	`ee538b6482e02aedbbe0ce5dd9c52dcf140a1740caf7c3634266649488817909`
Receipt	`output_validated; producer/checker return codes 0/0`

The supervisor command was `python3 tools/experiment_execution.py run --plan experiments/EXP-SSIQ-975f7e/trial-plan-v5.json --owner executor-ssiq-975f7e-v5 --epoch 1`. It ran in a network-disabled Linux container with Python 3.11.17, Linux 7.0.12-linuxkit-aarch64, the declared 128 MiB address-space ceiling, and a 60 second watchdog. The run receipt's execution checkout commit is `ff9b34232ad7112973641564290d3e60f735cc35` the thin checkout was assembled from the published branch after claim `b08667305b`.

The experiment source hashes recorded by the supervisor are `run.py=1ec6e0c35ed451e7a142b5ef7c5baf0479579a5e75bc9f2e7846b2c6381a88f9` and `check.py=b574781b55cb0b00515363d5290e7f3c3b32f26fdf89f2bb5675bee62b711e94`. The producer reported 0.000099709 wall-clock seconds for its arithmetic section; no CPU time or uncertainty estimate was recorded.

Declared inputs and recorded values

The driver scanned every integer from 31 through 180 inclusive (150 candidate integers), retained factors from $2, 3, 5, 7$, and used $X = 30$. The run recorded 41 eligible rows and `match_count=0`. The raw artifact contains all 41 ordered rows at `experiments/EXP-SSIQ-975f7e/runs/RUN-SSIQ-be0b59/raw-result.json` the producer manifest and all supervisor logs are in the same run directory. The recorded qualifying-row list is empty. This is a measured value on the declared finite input, not an extrapolation.

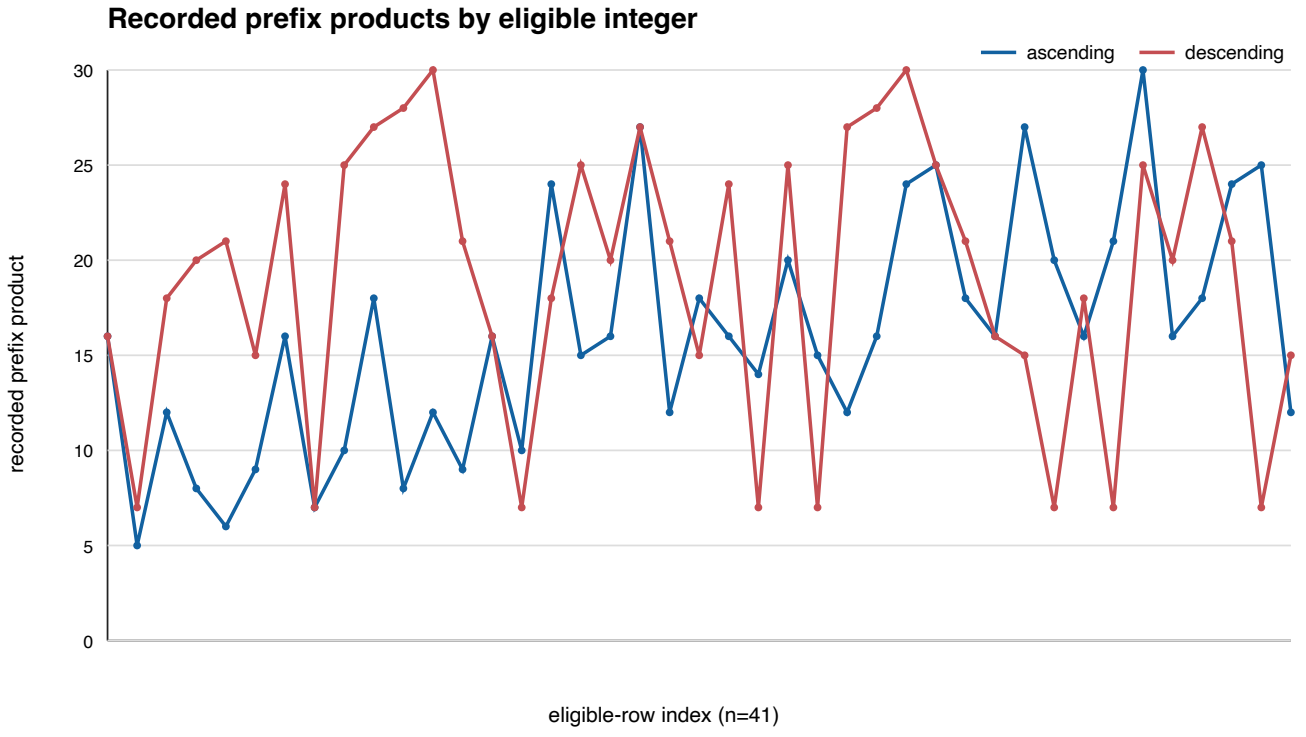

Figure 1: Recorded ascending and descending prefix products for the 41 eligible rows in `RUN-SSIQ-be0b59`. Points are the values stored in `raw-result.json` the plot adds no samples or recomputation. The editable graph source is `plot_graph.py` and its vector rendering is `prefix-plot.svg`.

Controls and certificate state

The supervisor's independent checker returned 0. The six recorded controls were all true: all degrees were in range; all retained factors were allowed; all products reconstructed their degree; 11 was excluded; 30 was excluded from the scored domain; and the 32-prefix equality held. The run manifest leaves the certificate as `kind: none, verified: false` the checker receipt is the validation record for this execution, not a broader claim.

Artifacts and limitations

The complete run directory is `experiments/EXP-SSIQ-975f7e/runs/RUN-SSIQ-be0b59/`. Its supervisor receipt records the exact artifact SHA-256 map, authority, plan hash, start and finish timestamps, and checker return code. No seed was declared because the scan is deterministic. Earlier custody attempts are preserved separately under `RUN-SSIQ-54cfe2` and `RUN-SSIQ-f80485` they were infrastructure failures and are not combined with this validated run.
