BINSTD source provenance and policy attribution audit

Validation audit, 22 October 2026

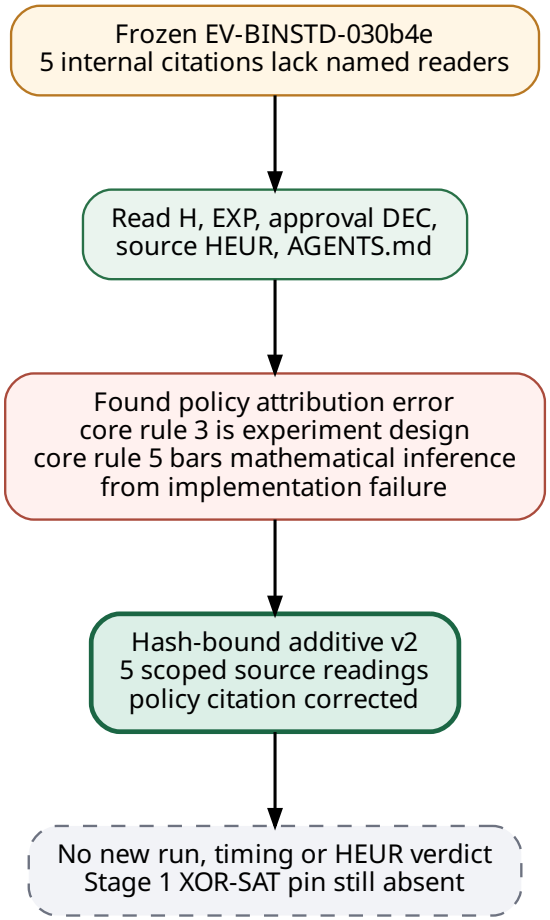
Question. Does frozen evidence record `EV-BINSTD-030b4e` attribute its five internal citations and infrastructure policy accurately? The record says Stage 1 could not measure the charged-cost band because the shared XOR-SAT pin was absent. This audit changes no experiment or verdict.

Source reading. The hypothesis, frozen n=17 experiment, approval decision, source proposal's wider heuristic, and `AGENTS.md` were read. The approved experiment tests $n = 17$, $\ell \in \{3, 4\}$ with at least 40 matched targets and a shared solver pin. The proposal's heuristic also names $n = 19, 23$, but neither was admitted in this Stage-1 test. The approval is not scientific support. No charged-cost comparison occurred after the pin was found absent.

Correction. The frozen evidence cited `AGENTS.md` core rule 3 for treating an infrastructure failure as non-mathematical evidence. Rule 3 concerns experimental design. Core rule 5 says timeout, crash or implementation failure is not mathematical evidence. A hash-bound additive replacement corrects three rule references and adds five source-reading notes. The frozen record is unchanged. A focused structured-diff checker confirms no other field changed.

Validation. The original SHA-256 begins `a65bd7986a54`; the replacement begins `159c0d02cac5`. The companion receipt records structured equality and the complete-tree validator's exact delta. On current base `13eb21767865`, unsuppressed errors fell from 141 in 39 paths to 136 in 38 paths: exactly five citation errors removed, none added. Both runs still exit 1, so the all-corpus gate remains red.

Boundary. Stage 1 remains an implementation impediment, not a measurement or falsification of the heuristic. No run, timing, performance curve, attack-cost bound, or scientific decision changed.



Frozen EV-BINSTD-030b4e
5 internal citations lack named readers
Read H, EXP, approval DEC,
source HEUR, AGENTS.md
Found policy attribution error
core rule 3 is experiment design
core rule 5 bars mathematical inference
from implementation failure
Hash-bound additive v2
5 scoped source readings
policy citation corrected
No new run, timing or HEUR verdict
Stage 1 XOR-SAT pin still absent
