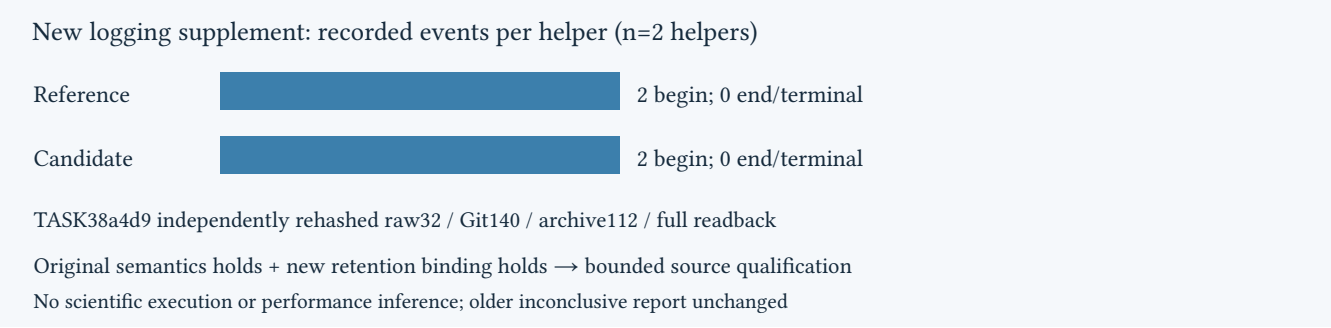
Frozen 015 source qualification

GOAL-ISOU-f30a07 · DEC-20261016-aea57d · TASK-20261016-409603



Observation

Fresh independent review TASK-20261016-38a4d9 holds interruption_invocation_retention_binding. Both existing native logging parents record 1 pass, 0 failed, 85 filtered, exit 0; each helper retains exactly 2 begin rows and 0 end or terminal records. The new report (126,714 bytes) / SHA256 201feda772aa22b665219a2ed7140bc1f617f0b6724e1d6767a1cb26b457ed93 and its five-file delivery are unchanged. All 32 raw files, 140 external Git objects, 112 archive members and the 683,995-byte full retained readback match. These are logging/control observations, not cryptographic performance data.

The original review 06cc13 source review holds exact reference semantics and identity; its original resource joint remains inconclusive. New prospective source/build/log/fingerprint/unit-hash bindings close the requested new retention link. Old absent raw evidence and invocation-time unit hashes remain missing.

Comparison and inference

DEC aea57d supports bounded source qualification for the four exact reference/candidate scientific binaries built from commit 015fa7bb504ef63953e0e04e464bb266f4f207bf. Source gate complete in this scope; scientific execution remains unapproved. The original 128-filter metadata expectation was wrong; the fresh reviewer derived 85 from raw logs before inspecting producer checkers. Separate correction did not rerun native controls. Both reviews passed the unchanged independence checker; new source-first note 6286249a7be28c9986c521efc218ecceb344e5a4229b8dcf49202fc73912b8d4 predates producer semantic maps.

Limits retained

Current 3ce full root check remains FAIL (4,161 passed, 1 failed, 117 ignored), exit 101. The separate filtered pass (14 passed, 4,265 filtered) does not replace it or establish cause. Frozen 015 historical serial 4,148 passed / 0 failed / 117 ignored and parallel failure remain distinct. Required CI/merge protections remain binding. No source default, current merged build or platform-wide correctness promotion.

Current unit hashes do not establish a hermetic rebuild or old execution receipt. Null child exit does not identify a measured signal; File::flush visibility does not establish fsync/durable-media persistence. Client byte/readback equality is verified, client source/build is not. No fresh independent network custody observation. Protected JavaScript parse diagnostic remains producer assertion; original wrong checker, rejected push, separate corrections and raw whitespace notices remain intact.

Lean scalar/finite-convolution lemmas, finite IDC1 supplement and written inverse/reversal/Rust reasoning retain separate scopes. Local LF fixture repair/native checks do not establish Windows-native post-fix execution. Both reviewers performed zero scientific/control-test/build operations. Actual served model/effort is unknown; native requested xhigh, separate low floor, no provider substitution.

Next action

Coordinator completes a fresh same-sealed-map P-192 degree-50341 A/B diagnostic protocol, with native controls, all phase/OS accounting, fresh IDs, explicit nonstarts, report/snapshot/review scopes and verified published inputs before / run. No scientific execution, larger construction, compact target, speed ratio, worldwide-record or security claim is approved here. One pair remains diagnostic; separate repeated controls precede a timing claim. Goal active; primary expanded boards remain ahead of secondary compact bounds.

No EV/KN promotion: engineering qualification only. Canonical scientific graphs and earlier findings checked and unchanged. Complete evidence paths, limits and exact archive hashes accompany this report.
