GFPN RDL-1 admission decision

DEC-20261011-94aad3 · EXP-GFPN-05ff43 · BATCH-e409ca · 2026-10-11

Scope. This is a procedural scheduling decision for `TASK-20260925-23c435`. Its claim tier is none. It does not score an ECDLP result or change the status of `H-GFPN-9a29be` or `HEUR-GFPN-DFLAT`.

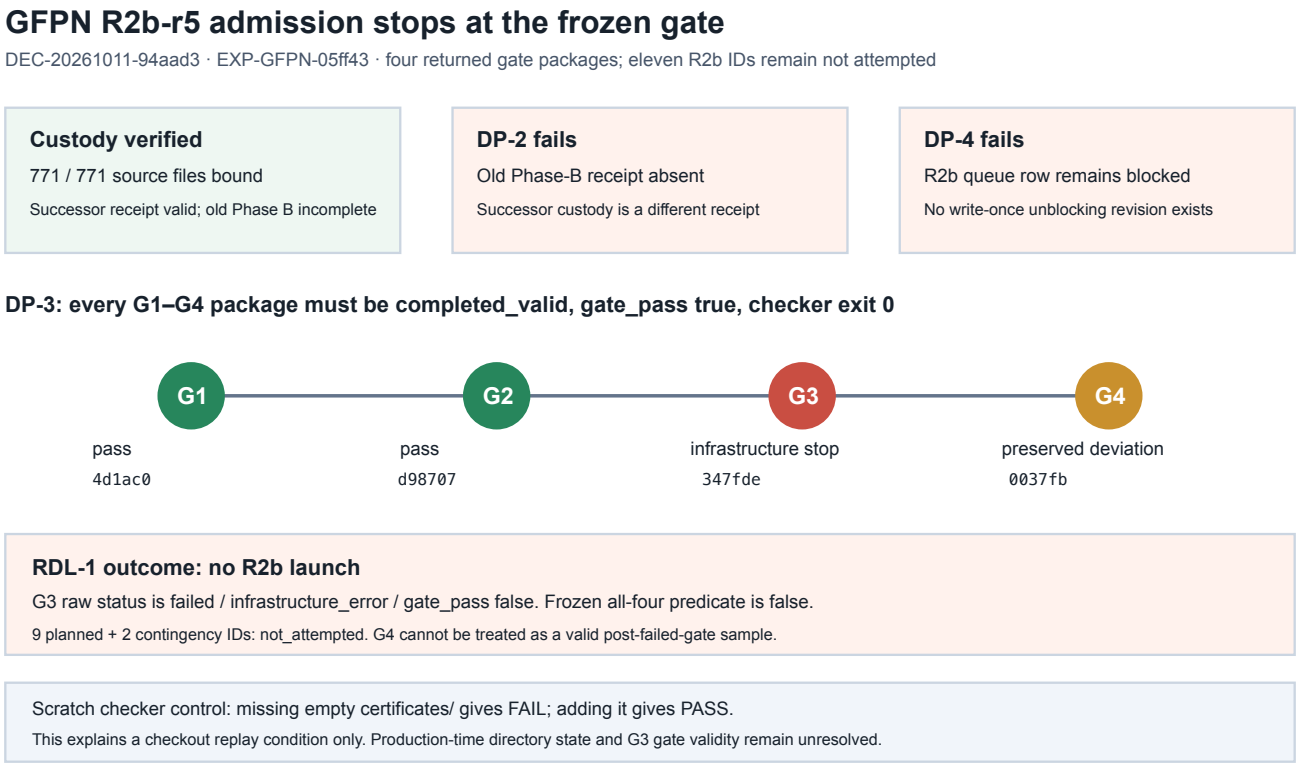

Figure 1: Frozen R2b gate, from `TASK-20260925-23c435` DP-2/DP-3/DP-4. Package observations come from `RUN-GFPN-4d1ac0`, `RUN-GFPN-d98707`, `RUN-GFPN-347fde`, `RUN-GFPN-0037fb`, and the immutable R2-r5 execution report.

Observation

The content-first receipt under `TASK-20261010-0fda2f` verifies 771 unchanged source paths in five commits (337 + 319 + 13 + 101 run files and one report). Its receipt-only commit is `0080cca50e6e80cea55062a57e96a33c680c1c99`. The old `TASK-20260925-0ed1be` Phase B has no post-run receipt and remains incomplete.

The original report records G1, G2, and G4 as `completed_valid` with `gate_pass: true`. G3 is `failed`, `infrastructure_error`, `gate_pass: false`. G4 was launched after G3 failed and is retained as a sequencing deviation.

Frozen-predicate comparison

DP-2 requires the old Phase-B receipt, which is absent. DP-3 requires **all four** gate packages to be `completed_valid`, `gate_pass: true`, and checker exit 0, plus REG-1 PASS. G3 fails that conjunction on its raw status and gate value. DP-4 requires an unblocking queue revision, which has not been made. RDL-1 therefore stops R2b-r5 before any run directory is created.

Diagnostic and limits

A fresh isolated checker replay in the custody receipt passes G1, G2, and G4 but fails G3 on `missing artifact certificates`; the original execution report recorded G3 checker PASS. A scratch reconstruction from exactly the 13 tracked G3 files gives checker exit 1 without `certificates/` and exit 0 after adding only an empty `certificates/` directory. All 13 tracked bytes remain hash-equal. `diagnostic.json` preserves the commands, environment, hashes, stdout, stderr, and exits. The control establishes sufficiency in the scratch copy; it cannot establish the production-time directory state or make G3′s raw gate pass.

Scheduling disposition

All eleven IDs in the frozen `trial-plan-v2-a1-r5.json` remain **not_attempted**: `RUN-GFPN-ba6fbe`, `2f652c`, `460cbc`, `b0461a`, `588be4`, `d68f02`, `4da222`, `027369`, `8eaa60`, `ad9594`, and `ce0dfe`. The final two are contingency IDs; their R-12 trigger was never reached.

G4 remains a preserved package and cannot serve as a valid post-failed-gate sample for this admission decision. No R2b package, reviewer, or scientific trial is dispatched. This disposition makes no claim about the mathematical hypothesis or curve security.

Evidence and next gate

- Frozen dispatch contract: `ledger/handoffs/TASK-20260925-23c435.yaml`, DP-2, DP-3, DP-4 and R5BP-2.
- Source observations: `experiments/EXP-GFPN-05ff43/execution-report-v2-r5.yaml`, four `RUN-GFPN-*` packages, and `TASK-20261010-0fda2f/content-first-receipt.json`.
- Scratch control: `diagnostic.json`, reconstructed from G3 source commit `61004685f4750553a59bc4ee7a776cb5e69754f2`.

Before any claim-changing interpretation of G3, G4, G1/G2, or the heuristic, the Coordinator must commit a review plan with a recorded prior, independent joint owners, blind rederivation, and a known-false post-failed-gate control. The relevant canonical frontier graphs were checked: this procedural stop changes no measured bound or claim tier, so no canonical graph content changes.
