Source-bound ledger triage

2026-10-22; crypto-autoresearcher audit branch

Gate result. The complete-tree ledger validator still exits 1. Unsuppressed messages fell from **162 in 49 paths** to **157 in 47 paths** after two source corrections, then to **152 in 42 paths** after merging main 53c4975c34, then to **147 in 41 paths** after a source-read citation correction. Each step removed exactly five lines and added none; the prune-only baseline was not expanded. Counts are validator messages, not scientific conclusions.

Error class	Original	Source	Merged	Final
Prior-art metadata	66	66	66	66
Review/handoff fields	32	32	32	32
Citation provenance	28	28	28	23
Run-manifest schema	19	19	19	19
Broken references	7	6	1	1
Zero-compute stage artifacts	5	5	5	5
Experiment-spec fields	5	1	1	1
Total	162	157	152	147

Source corrections. The frozen approved ECDLP toy specification already states its O-FLOOR and O-EXCESS thresholds. A hash-pinned complete replacement adds only three schema fields: singular success and falsification criteria and decision impact. The original specification and trial-plan binding remain byte-identical. A QSP evidence replacement removes one expired attempt from structured run IDs. That attempt has only a claim-expired execution receipt, no run manifest, no raw result, and no scientific conclusion. The replacement still cites the receipt and describes the failed attempt. A third replacement names actual readers for five internal citations and corrects one no-solving-degree-drop attribution from an established result to a prediction. Source checks and 11 schema-supersession unit tests pass.

Open integrity gaps. The QSP Stage 0 hand derivation ran no program. Its five missing command/output artifacts remain honestly reported; a non-execution category needs a scoped validator rule and negative controls. The Frobenius proposal's five citation errors are cleared, but 23 other citation-provenance errors remain. The ledger gate still has 147 errors, and the reader still reports 24 unparseable historical originals, 15 without registered replacements.

Dashboard boundary. These corrections produced no timing or benchmark datum. The nine primary comparison rows retain their pinned snapshot hash; this report does not replay separate run graphs from main. A full local reader build on code commit 11c9ae1b88 emitted 55,248 files, 522.0 MB, and 27,550 records. Its comparison payload has nine rows and no error; the deep reader reports 24 unparseable originals (nine hash-matched copies and 15 raw-only). A generated-page check also confirms that three parseable originals show their registered schema copies in separate tabs, without changing the original source or parse state. A read-only public check at 10:35:27 UTC found the Pages workflow still manually disabled and live metadata still at an October 11 commit. No hosted refresh is claimed. The accompanying Markdown report, SVG, counts JSON, full validator logs, site receipts, and source-check receipt contain the exact evidence.
