ECDLP worksheet execution: actual native closeout

Descriptive operational record; no scientific interpretation or hypothesis/goal promotion.

Published source snapshot: d4d756bbfe915981ea21a8d832504de600aae161

Every retained attempt is counted, including invalid outputs and pre-scientific infrastructure failures. Independently recomputed checks do not replace either separately allocated primary route.

Native status	Actual RUNs
infrastructure_error	2
invalid_output	7
output_validated	32

Total actual attempts: 41. Verified receipt-bound artifact digests: 448. Complete native reproductions in conditional18 mapping: 18/18.

Scope and limits

The historical audit did not name its eighteen contracts. The reproducible candidate set is conditional, not an authenticated reconstruction of audit membership. Six entries are unchanged legacy metadata reproductions; twelve finite scopes use two distinct primary routes. The explicit c9 descriptive successor retains both truncation conventions and the old definition gap. The adjacent nineteenth instrument is separate and retains its weak vocabulary/file-presence checker without independent arithmetic certification.

Preserved scientific boundaries

The original square-bias strict prediction misses; the slope scanner remains unscored. The finite chord-sign prediction is false although measurement controls and independent arithmetic agree. A control-valid negative observation is not discarded. No repeated deterministic value becomes a new proof, security estimate or general ECDLP advantage.

Whole-ledger checks retain historical and intentionally preserved invalid-manifest errors. Exact current gate logs and their baseline delta accompany this report. Honest deterministic null seeds retain the separate integer-only schema discrepancy. No unavailable model, runbook, inference binding, or execution-proof certification is asserted.

Conditional eighteen: exact original-to-execution mapping

Original EXP suffix	Execution EXP suffix	Accepted / expected

Adjacent nineteenth: EXP-ECDLP-daee4d → EXP-ECDLP-324080; actual stages 2; statuses output_validated, output_validated.

Full exact commands, source/plan/environment hashes, metrics, prediction comparisons, raw files and actual failure details are in actual-native-inventory.json and the individual inspected reports. Dated earlier reports are preserved.

This grouped document summarizes native operational records; it does not perform independent claim-tier scientific review.
