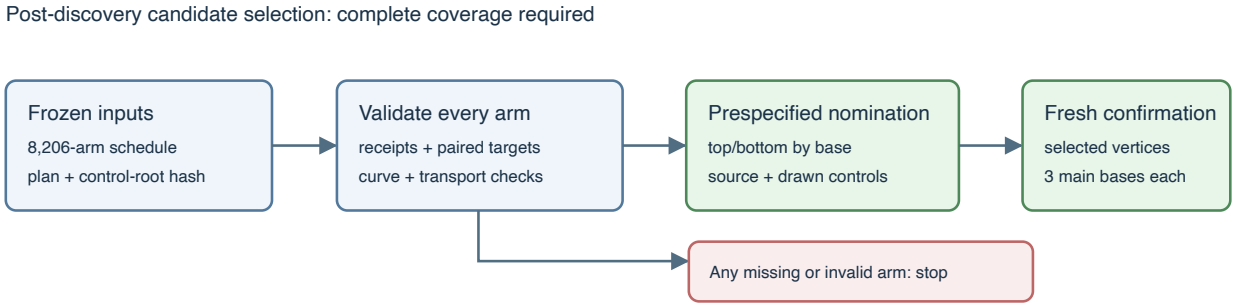
Discovery selector implementation control

2026-10-22. This candidate code nominates confirmation vertices only after every scheduled discovery arm has a hash-bound supervisor receipt and the independent checker succeeded. It checks prepared curve identity and paired target coefficients across arms. An incomplete or tampered run stops selection.



Three synthetic tests passed: full schedule shape, tie breaking and coverage; and one supervisor receipt with an altered raw result rejected. These tests do not supply scientific yield, confirmation intervals, or ECDLP costs. The Coordinator must freeze the implementation and control-index root commitment in an approved runnable contract before the fixed discovery stream is collected.
