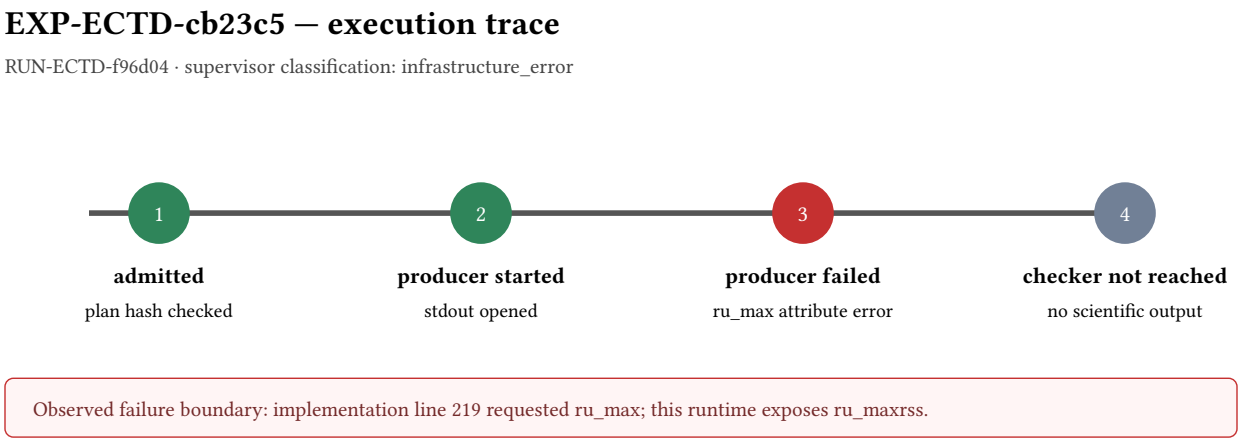
EXP-ECTD-cb23c5 execution report

Observation-only record for `RUN-ECTD-f96d04` (least-prime-one-edge).

Scope and disposition

The repository supervisor classified this single frozen trial as `infrastructure_error` and `needs_reconciliation`. No scientific output was produced and no hypothesis or goal status changes.



Frozen inputs and custody

- Experiment: `EXP-ECTD-cb23c5`; trial: `least-prime-one-edge`; run: `RUN-ECTD-f96d04`.
- Plan SHA-256: `5f29a49a3539cdbfcd6a1ec260b23b8f84ff99dea670c1cddc1b1f8430e54dae`.
- Execution checkout: `fd715c3ee81d51ff90cb10031cc5a3d99f5d7a42`.
- Dispatch-plan SHA-256: `8e37027ee0f052c2b23a9a02a64419645c83d2e7dcd4eb9ccab93f685318671d`.
- Owner and lease: `executor-ectd-cb23c5`, epoch 1.
- Container: `crypto-ci-python:20261008`; network disabled; virtual-memory limit 131072 KB.

Recorded observation

The producer returned code 1. Its traceback ends at `implementation/run.py` line 219:

```
AttributeError: 'resource.struct_rusage' object has no attribute 'ru_max'.
Did you mean: 'ru_maxrss'?
```

The checker was not reached. The run receipt records `status: infrastructure_error`, `check_returncode: null`, `published: false`, and no scientific conclusion. Raw logs and supervisor records are preserved.

Interpretation boundary

This record establishes only that the execution environment rejected the producer's resource-usage attribute access before result emission. It does not evaluate the curve construction, prime selection, quotient map, or any mathematical mechanism. A portability correction requires a separately coordinated additive implementation change and a new frozen run.
