Direct runtime and period-source follow-up

2026-10-24 · Exact-session verification and source inspection · Named orders executed: **0**

The Coordinator access obstacle has an available route

The existing authenticated Codex CLI serves the repository's existing Coordinator binding. Session 01a16fe0-9920-7c30-a1dc-75871417fbb9 was verified as gpt-5.6-terra, high effort, OpenAI provider, CLI 0.155.1 and read-only sandbox. The verifier checked the single session's metadata and runtime bindings. It did not verify a global model catalog or change model bindings.

Attempt	Recorded observation
Direct GPT-6.1 alias	Launch exit 1; no verified thread. Global availability remains unknown.
Sol against Terra binding	Policy mismatch rejected before launch. No substitution allowed.
Exact Terra binding	Exact session verified; no global backend validation.

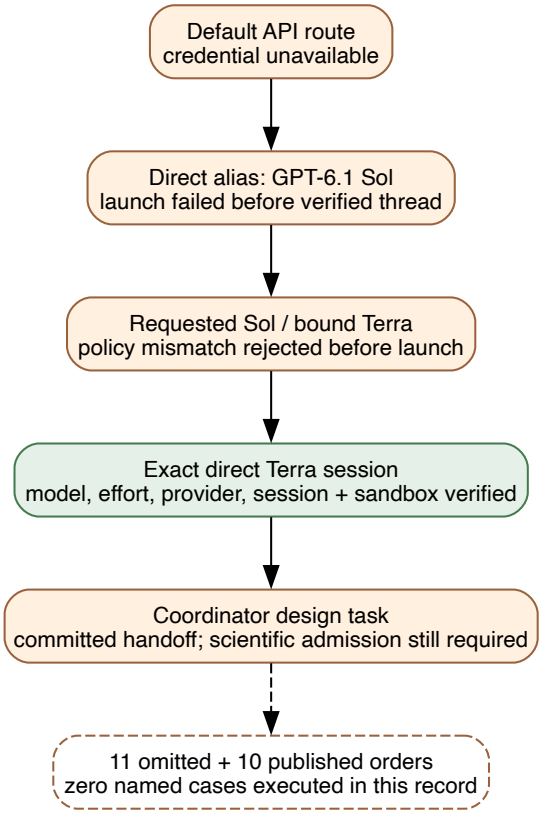

Figure 1: Three retained probe attempts and the remaining scientific admission boundary. Source: followup.dot; evidence: direct-coordinator-probe-v1 through v3 receipts.

The user-request routing handoff and archival scope were committed/pushed at 4133eb3dd7d3cd116b584d376b0ba45e16a444b0 before resuming the verified Coordinator session for prospective design. This is not experiment approval.

Period implementation choices: what can distinguish the cohort

The primary 1998 De Win–Mister–Preneel–Wiener paper discusses the a=-3 projective specialization, binary-field representations and timings assuming an already available group. These do not measure candidate generation. Its June 1997 draft citation supplies no rejection log. Inspected sections: 3.4, 4.3–4.4, 6 and reference A97.

Existing exact metadata independently confirms all 21 representatives have a=p-3. A predicate requiring only that identity accepts both omitted and published sets. Actual operand-dependent timing and unpublished implementations remain unmeasured. Binary-field representations do not classify these inputs.

Source: cosicdatabase.esat.kuleuven.be/backend/publications/files/conferencepaper/69. The source PDF has 161,370 bytes; SHA-256: `c31e0c938e9cce8fa34204391dc7d844c693ec6559380fb6aad1d57914f96b83`

Bounded archive query

The retained Internet Archive query searched identifier:x962* or the exact algorithm title, requesting 50 metadata rows. It returned five items. The only historical X9.62 draft was the already recovered November 1997 artifact. No earlier draft was acquired. This limited index query does not establish absence of other aliases, unindexed files or surviving copies elsewhere.

Remaining scientific admission

All eleven omitted and ten published orders remain pinned and unexecuted in this record. The complete prospective trial plan, artifact coverage and handoff still require a retrieved preapproval result and committed Coordinator approval before normal run admission. No outcome or approval is invented. The commonality and original generator/caller remain unknown.

The canonical admission diagram changes only for the verified direct route. No mathematical frontier, isogeny, endomorphism or weakness graph changes. The earlier runtime PDF is retained as its historical snapshot; this follow-up corrects the implication that a missing default API credential leaves no available Coordinator route.

Evidence: source-checks.json; ia-x962-search.json; direct-coordinator-probe-v1, v2 and v3 receipts; TASK-20261024-6739a9; TASK-20261024-4cd91d; assessed.json and traits.json from the exact cohort archive. Observation and interpretation remain separate. The coefficient check is catalog inspection, not a new primality, attack or performance trial.
