Run report — EXP-BINSTD-8bdf86

observations-only record; stages 0–1; UTC 2026-10-11

This report records observations only. It does not promote, weaken, or review the hypothesis. Both trials completed under the frozen protocol in a Linux container, and both independent checker invocations returned zero.

Identity. Experiment `EXP-BINSTD-8bdf86`; hypothesis `H-BINSTD-5a212b`; goal `GOAL-ECDLP2M-001`; approval `DEC-20261003-555f72`; successor task `TASK-20261011-98ecf7`; plan SHA-256 `4aada724b476b9b8792637d28948f7811abba918a325b8649cb612d404f0e729`. The supervisor recorded commit `9169922cf5462927f36632b33648705642c0aaa8`. The host was Linux with Python 3.11.17 in the local `crypto-ci-python:20261008` image. The container was bounded to one CPU, 1 GiB RAM, 64 PIDs, and no network; the trials used their declared 512 MiB per-process address-space ceilings.

Trial accounting

Stage	Run ID	Start	Finish	Wall (derived)	Checker
0 freeze	`RUN-BINSTD-969bcc`	18:25:20.475599	18:25:20.659547	0.183948 s	exit 0
1 gate	`RUN-BINSTD-6a482f`	18:25:27.009172	18:25:27.212941	0.203769 s	exit 0

Wall values are derived only by subtracting supervisor timestamps. CPU time, peak RSS, and rate uncertainty were not recorded and remain missing.

Frozen parameters and observations

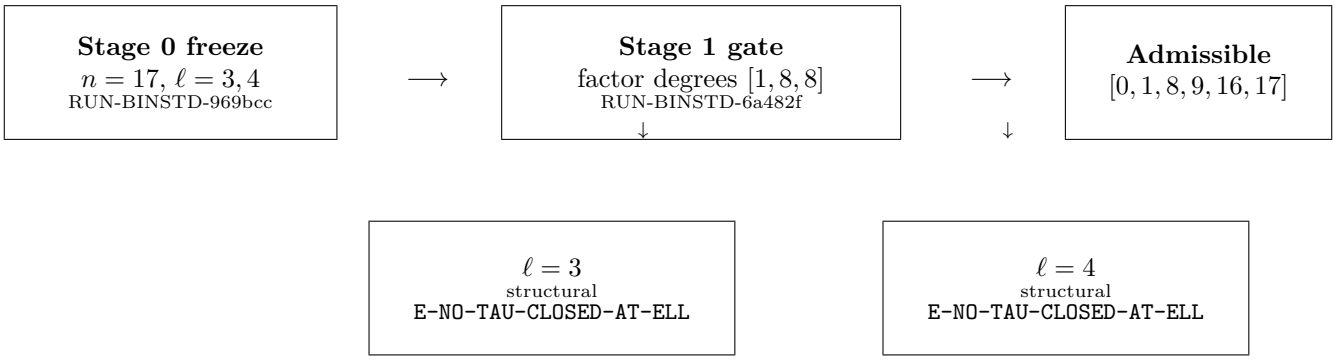
Stage 0 froze $n = 17$, $\ell \in \{3, 4\}$, target count 40, seed 9049049433885666, and band 1.25. The solver pin was `exhaustive_fb_sum_m3_stdlib_gf2`. The recorded stage-0 outcome was `S0-FREEZE-OK`. Stage 2 was not authorized.

The factorization artifact records irreducible degrees $[1, 8, 8]$ for $x^{17} - 1$ over $\mathbb{F}_2$. Its derived subset-sum dimensions are $[0, 1, 8, 9, 16, 17]$. The two frozen cells were recorded as follows:

Cell	Label	Status	Ratio
$\ell = 3$	`E-NO-TAU-CLOSED-AT-ELL`	structural	missing
$\ell = 4$	`E-NO-TAU-CLOSED-AT-ELL`	structural	missing

No yield ratio was evaluated because neither frozen cell is in the derived admissible-dimension set. The labels are recorded cell outcomes; they are not measured rate comparisons.

Executed pipeline diagram



The diagram is derived from the sealed run artifacts; it is a pipeline diagram because no comparable rate values were produced. Source data: `graph-data.json`; vector rendering: `graph.svg`.

Scope and missing data

No factor-base-sum rate, ratio, uncertainty interval, spread, or sample distribution exists for either cell. The observation is scoped to the finite $n = 17$, $\ell = \{3, 4\}$ protocol and its declared implementation. The machine-readable receipts, manifests, raw results, and checker logs are retained in the two run directories; the stage-1 admissibility artifact is `stage1/admissible-phi-dims.json`.
