Output-contract review procedure decision

DEC-20261025-5b84e8 · GOAL-ICPERF-e6b6a4 · 2026-10-25

The first independent Validator reported O1, O2 and O3 holding only on no-science canned engineering controls. Its immutable attestation recorded two pinned independence-check failures. This decision withholds engineering source acceptance and freezes a fresh two-session review. No scientific status or performance claim changes.

Observation

The blind derivation was sealed at commit 932e5d00147cc206a5a15144f5001d928c3d5259 before candidate reads. Snapshot TASK-20261025-6d007d binds the derivation, report and attestation at 9eb226fb6a87b8e66c8befd7d0149b0d42c0c90e. The frozen plan omitted a rationale for its broad lift. The final attestation lists six protected paths read after unblinding. The pinned checker failed on both.

Comparison and inference

The report records two complete canned terminals and four rejected controls, plus additional single-field mutations. Those are bounded engineering observations. The historical RUN-ICPERF-eb0d88 remains invalid_output. The actual blind seal timing does not make the single final read list pass the mechanical procedure check. No source acceptance follows.

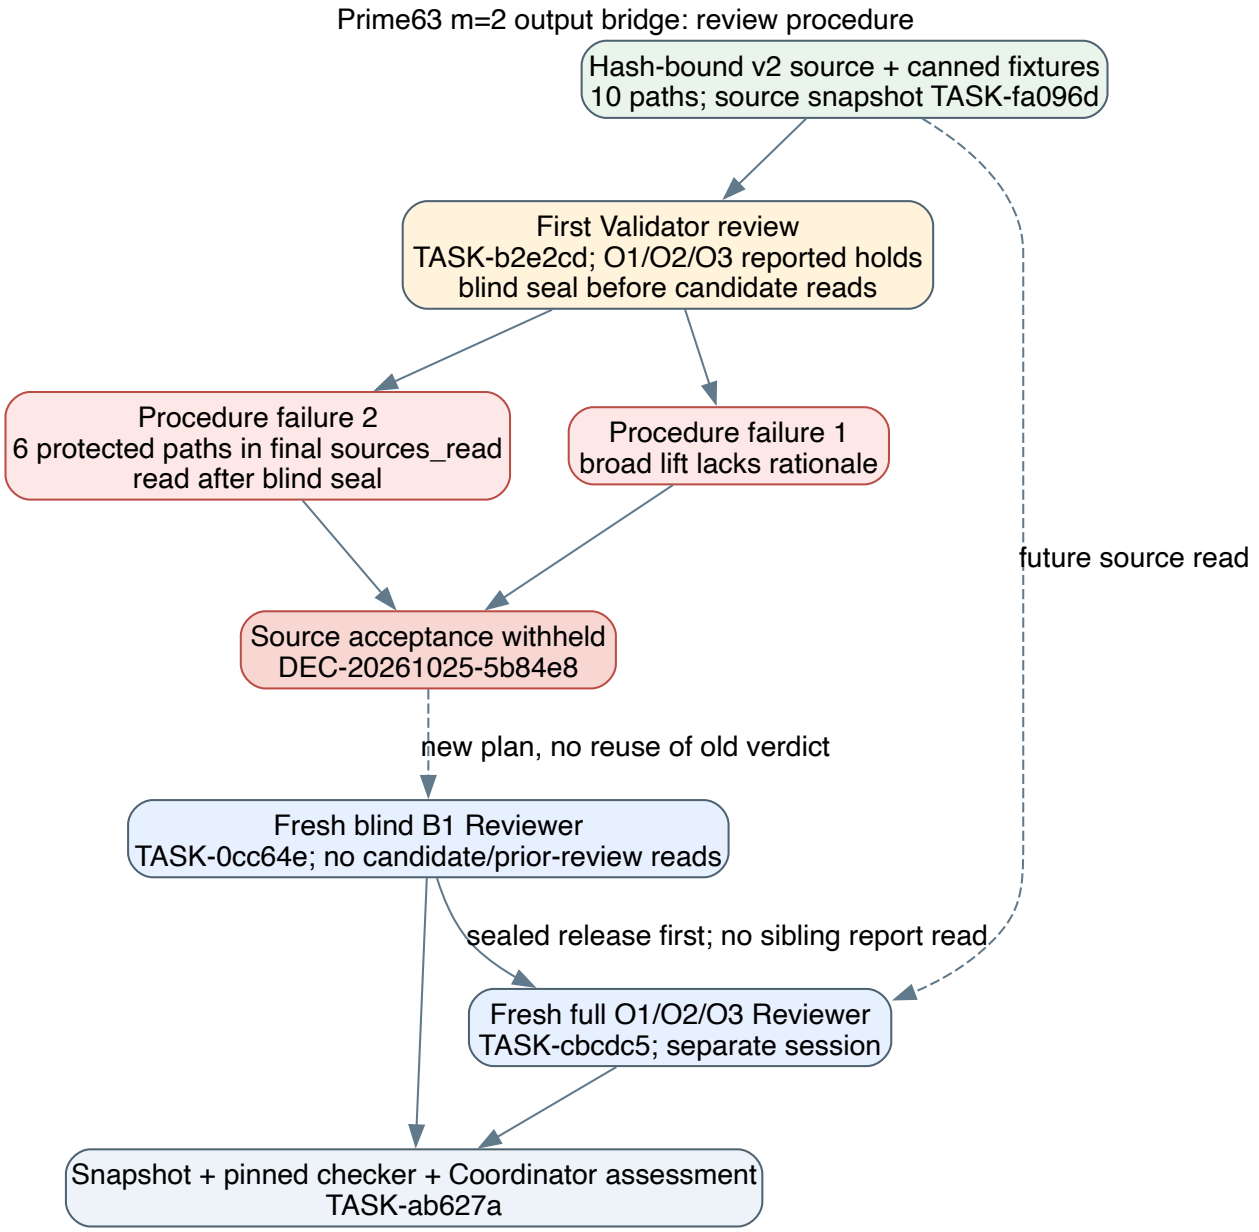

Figure 1: The two failed procedure gates and the prospective split remedy. Dashed edges are future work; the diagram does not assert an accepted source or scientific result.

Decision and next action

TASK-20261025-0cc64e must derive B1 blind in a fresh exact independent xhigh session. TASK-20261025-cbcdc5 then attacks O1–O3 in a distinct session without reading sibling or prior failed outputs. TASK-20261025-ab627a snapshots both reports. Only a pinned checker PASS, truthful source lists, exact sessions, verified releases and substantive Coordinator assessment can support a later engineering acceptance decision.

Limits and citations

No solver certificate, relation yield, rank, complete IC cost or speedup was measured.
