Direct-Python recovery: source and CLI conformance

Source preparation only; 18 October 2026. Six new outer experiment identities reuse unchanged finite arithmetic, controls and false predictions. No frozen scientific cell was executed by this handoff. Actual source/config closure hashes and prospective two-route layouts are in `implementation-receipt.json`.

Old95f attempt RUN-ECDLP-f67842 failed before native compilation because a prospective `env GIT_CONFIG_*` prefix was absent from the Python helper's actual executable/script argv. The unchanged helper correctly refused the mismatch. Failed records and unlaunched old plans remain unchanged.

Actual synthetic regression. The byte-identical helper runs as real subprocesses in a disposable isolated Git checkout with two tiny unrelated C++ fixtures and explicitly synthetic provenance. Under an exact1GiB address-space limit, direct absolute Python primary and independent checker commands pass; the exact observed env prefix is refused with the original error before any native compilation/output. This is not a real supervisor admission, production receipt, mathematical experiment or invocation patch. The fixture-only Git initialization/commit was explicitly authorized; no shared-repository commit/push occurred.

Metadata boundary. New configs change only outer identity, specification path and source-dependency metadata. All56 protected old files were rechecked unchanged. The NEW mutable canonical spec is excluded from the source closure; mandatory plan specification hash binds final approval bytes separately. Direct commands contain no wrapper, interpreter flag or process-local Git override. c9 retains original-compatible clipD prediction flag and descriptive full clipDplus1 values. Validity and prediction match remain distinct; no false prediction is corrected retrospectively.

Still required. Coordinator publication, prospective review/approval, final source/plan/claim admission and two separate real primary runs per contract. Synthetic conformance does not replace those gates. No canonical mathematical graph, performance rate, attack cost, proof/model claim or scientific status is promoted. Sources: handoff TASK-20261018-ab678b, `README.md`, `synthetic-cli-v1/receipt.json` and the retained synthetic fixture archive.
