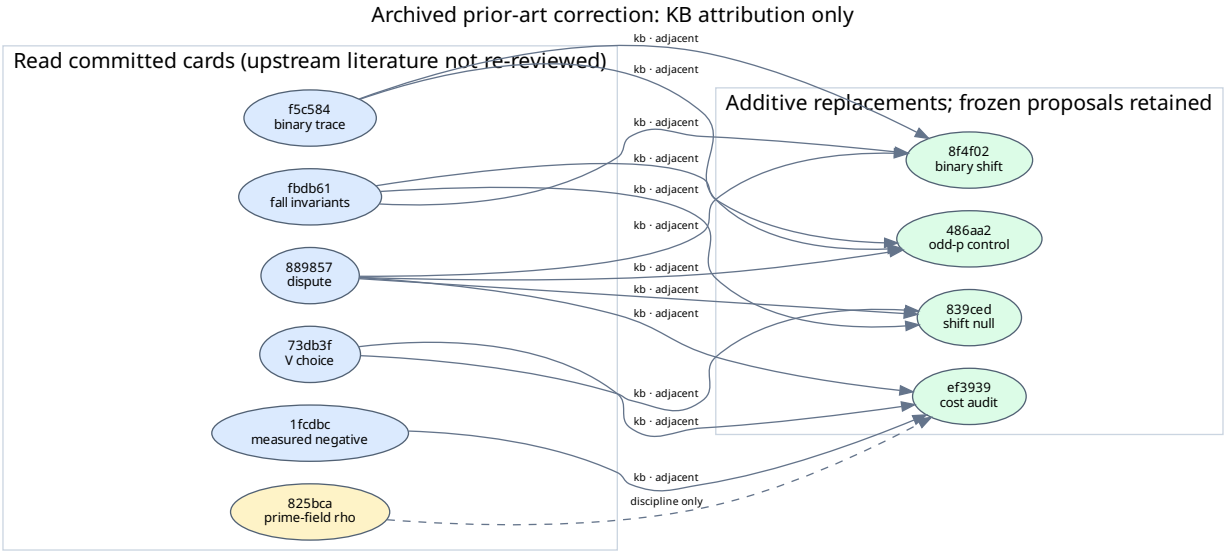
Four archived prior-art metadata corrections

Source-bound validation note

2026-10-23

Scope. Four frozen October 6 proposals had a descriptive frontier-map value and untyped nearest-prior-work relations. The originals remain unchanged. Hash-bound replacements name the actual index-calculus directory, use KB provenance and the adjacent relation, and preserve each original description in a detail field. No trial, proof, numerical claim, or hypothesis status changes.



Source boundary. Six committed knowledge cards were read. Their upstream literature has mixed reading states and was not independently re-reviewed. The prime-field rho card contributes accounting discipline only; its constants are not transferred to a binary baseline.

Validation. On parent commit `9fc0685a5fd5`, the complete-tree ledger gate reported 118 unsuppressed errors. With these replacements it reported 88: exactly 30 targeted lines removed and zero added. Both runs exited 1. A focused checker confirms SHA-256 bindings and all non-prior-art parsed fields. The broader ledger and theorem-to-claim fidelity remain open.

Evidence. See `REPORT.md`, `validation.json`, the two validator logs, the six named KR cards, and the four registered supersessions in this PR.
