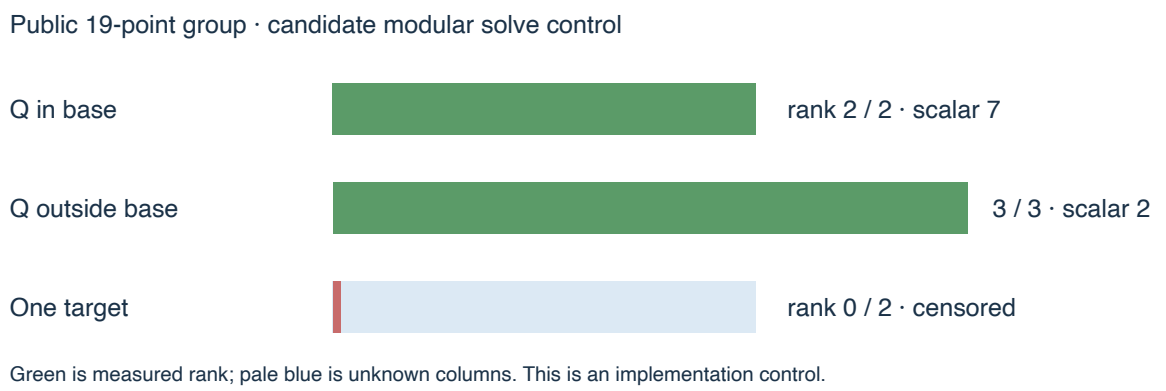
Candidate modular solver implementation controls

2026-10-22. On the public 19-point group, the Q-in-base case had rank 2 of 2 and recovered scalar 7. The Q-outside-base case had rank 3 of 3 and recovered scalar 2. A one-target input had rank 0 of 2 and remained censored.



A separate Sage checker verified each completed Q scalar, all three base orbits, 18 targets and 56 reported triples per full control. A copied scalar changed from 7 to 8 was rejected. Saved JSON contains internal phase times only; this control does not measure P29/P37 full solve feasibility, end-to-end ECDLP time or matched rho.
