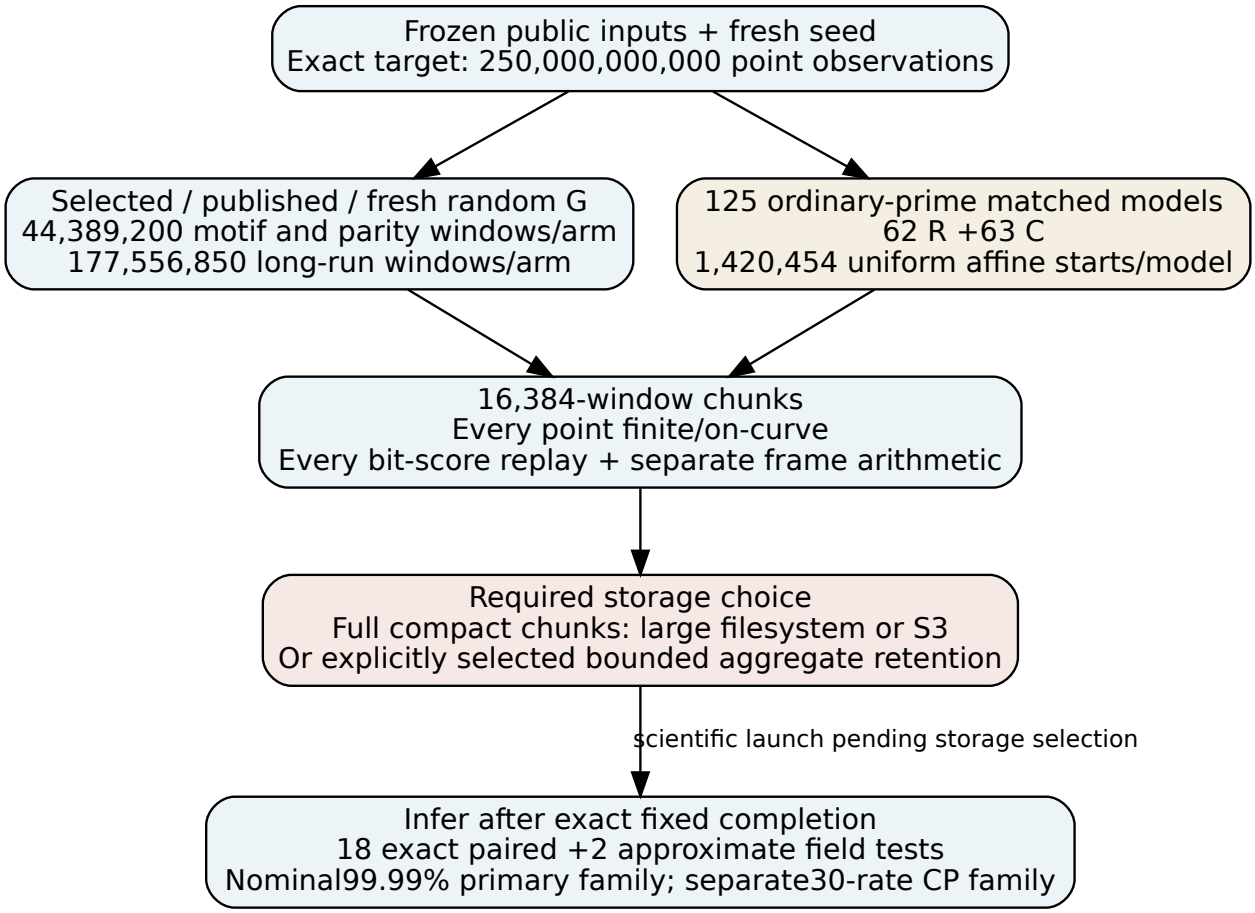
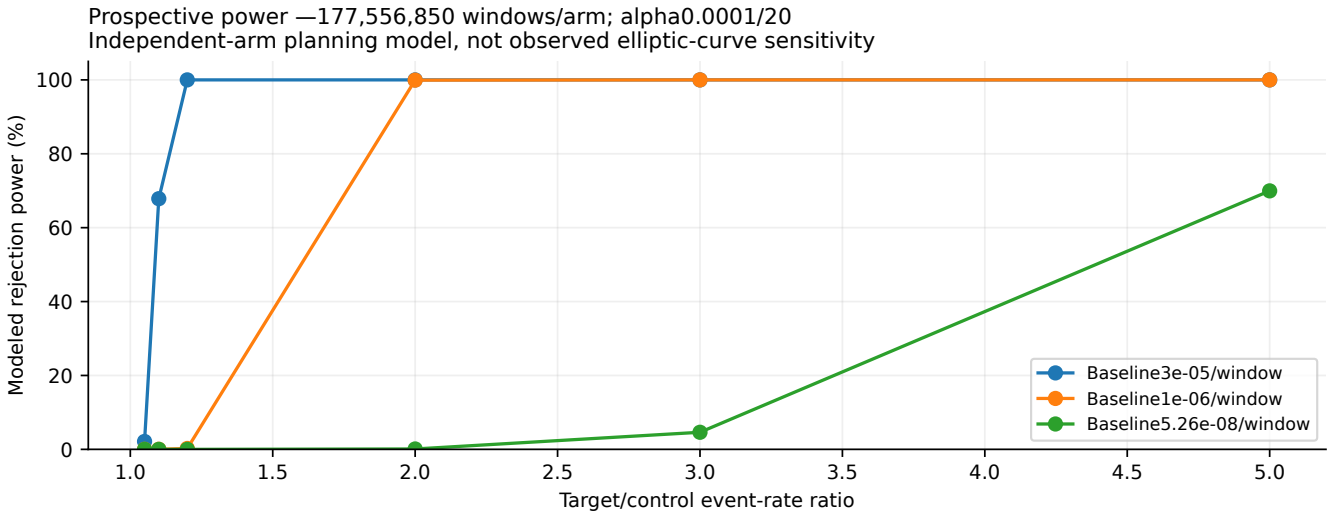
250-billion campaign preparation

Preparation and engineering observations only. The scientific run has not been launched; data destination/retention selection is required.12 October2026.

Exactly250,000,000,000 point observations;976,562,500256-point window observations;443,892,000 independent-start draws. Named cohorts share Q. Actual published G and fresh rG controls;125 ordinary models (62 R+63 C). Coefficients and step x matched; group/step orders unmatched; primes reused.



Prospective power and launch dependency



Primary:18 exact paired+2 approximate field tests; alpha0.0001/20, nominal99.99% with field-approximation caveat. Separate30-rate CP family, nominal99.99%; union nominal99.98%. Infer only after the exact fixed target; no interim p-value stop.

Doubling a1e-6 baseline has99.93% modeled power. Doubling the fair-coin run32 reference5.26e-8 has only0.104%. Independent-arm planning assumptions; actual dependence changes power. Fair coin is a benchmark, not a point-bit IID premise.

Five distinct-seed engineering tests passed. The13,312-point fixture verifies 14-job aggregate/resume/ analysis and corrupt-record refusal. Native complete coordinate hashes, bounded frames and resource stops checked. Fake S3 validates checksum/error logic, not live AWS access. All125 public model order/ membership preparations passed. No250-billion result or separate research review is claimed.

Current filesystem:32 GB total, approximately550 MB free; no configured AWS identity in runtime revision121. Full compact data need roughly60 GB (reserve70). Choose configured S3, larger storage, or explicit bounded aggregate retention. Aggregate mode stores exact counts/hashes and fixed full-frame samples, rather than every bit string for later arbitrary ML searches. Old data remain intact.

Agent-free resumable CLI: tasks/solinas_250b/README.md. Source/protocol/input and power records at tasks/solinas_250b/{PROTOCOL.md,inputs.json,control-preparation.json, power-plan.json,test_campaign.py}. Storage obstruction: problems/ solinas-250b-storage-unavailable.md. Predecessor: PR2108. Internal sources only; no new mechanism, official scientific transition or ECDLP-strength/cost claim.
