Four worksheet scopes: actual native execution record

Scope. Operational observations only. Four fresh metadata-compatible reproductions were actually accepted. All original scientific fixtures, drivers, checkers, counts and thresholds remain unchanged. This is in-sample deterministic calibration, with no hypothesis, goal or attack-claim promotion.

Original EXP suffix	Valid fresh EXP / RUN suffix	Native status
bfbe6f	4bb0ef / 25c448	output_validated
5f4f14	087aea / 42ded6	output_validated
3c166b	11c54d / d9188a	output_validated
20ac31	5d6ec1 / 6671fe	output_validated

The four original native attempts remain invalid_output despite driver/checker exit zero. The intermediate 3521b9 / 03ccb4 attempt remains infrastructure_error before any scientific driver: Git could not create threaded lstat under 256 MiB. Eight native files are retained; four adapter outputs were never emitted. No failed task or old receipt was rewritten.

Exact correspondence. Read-only byte comparisons confirm each accepted reproduction's raw-result.json and preserved legacy-manifest.yaml equals its original actual output. All four drivers and native checker phases exited zero. This validates the scoped metadata reproduction route, not an independently reviewed mathematical result.

Observed values. S3 and half-count retain planted_ok=true, matrix_holds=true, beyond_matrix=false. Slope retains scanner_ok=true, scored=false, planted_ok=false, matrix_holds=false, beyond_matrix=false. Square-bias retains planted_ok=true, matrix_holds=false, beyond_matrix=true. The slope is still unscored.

Runtime repair and limits. Three untouched slots used process-local core.preloadIndex=false. A fresh S3 EXP/RUN/TASK prospectively bound the setting in both exact command arrays and passed native preapproval before execution. Scientific bytes and the 256 MiB ceiling stayed fixed. Raw archives were published before reports. Native exact Git and queue verifiers pass; full-ledger validation still reports207 errors (163 historical plus44 retained malformed original manifests), with zero-delta design/approval checks. No global green is claimed.

Reproduction pointers. This directory's four-valid-reproductions.json, all-nine-attempts.json and raw-archives.json name exact source/run paths, metrics, native status and Git SHAs; README.md links all run reports and scoped problem resolution. Canonical scientific frontier/isogeny graphs were checked and left unchanged. The audit's unspecified original eighteen-contract set is not declared complete; no director binding, formal execution proof, or new mathematical theorem is asserted.
