P37 source-base transport: edge 21 control

Observation-only report, 2026-10-20. This control checks saved map and base arithmetic; no relation targets were collected.

Inputs

P37 over $F_{81640512137}$, prime group order 81640511861, 1,600 x-orbits (3,200 signed points). Archived walk SHA-256: `523686cad4acf24d6c54dc73e25c9527fcd6337912643053674ca5b87129d281` . Producer script SHA-256: `2829ef00e3727216f91bda4cccb386f3ea54db7fcdedf87954b5eab3362cc84e` . Sage 10.10.rc0.

Observations

Edge 21 destination $j = 49775280396$. Checkpoint SHA-256: `d2e283edb3ab0cbb4078d8c01b587c8ab25b0dcf11194324d8e8eef7eb982f54` . Per-edge timer: 7.393 s. Producer wall 25.83 s; verifier wall 5.56 s. Independent replay: status pass, 21 edges and 67,200 point images; terminal hash matches checkpoint.

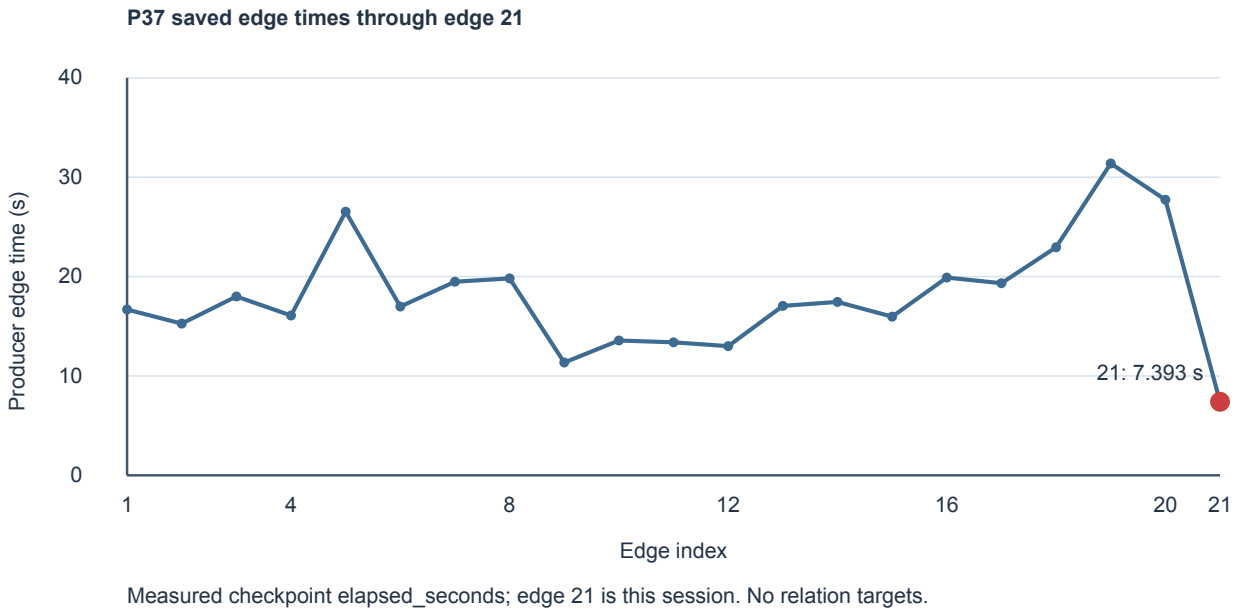

Figure 1: Checkpoint-recorded edge times. Edge 21 was produced in this session; edges 1–20 are prior controls.

Scope

The verifier independently checks the saved edge and full signed-base map chain. Edges 22–256 and all relation-yield, rank, and ECDLP measurements remain open. Exact commands, logs and source script are in the accompanying Markdown report.
