Compact native source review

TASK-20261016-3d848c / archive TASK-20261016-36fb10

Public source9a2 → independent static review

Math paths hold at review scope; required RSS negative control missing

Later zero-RSS finding → repair + resource retake → custody gate unchanged

Observation

Independent static review inspected pinned public source9a2e133099, without binary execution or restricted clean-retake payload access. The independence checker passed ownership, blindness and declared-control checks. Actual served model/effort remain unexposed.

Comparison

Four normal-public-path source joints held at review scope. Complete required-control coverage broke: the frozen plan named lost/zero RSS, while public test definitions checked positive RSS only. These are source findings, not executed test results.

Inference

Parent later identified a distinct post-acknowledgement zero-RSS acceptance gap in supervisor.rs261–263. The independent report stays unchanged; coordinator-addendum.md records the later finding. Resource admission needs repair and an independent source-joint retake. No false mathematical acceptance was demonstrated.

Limitations and next action

No M8191 result or scientific approval follows. Trusted SEC2 p/n primality remains explicit. Compact representation remains separate from expanded maps. External-transfer approval and immutable remote custody remain pending; this report transfers no blocked payload. Parent implements deterministic missing/zero/lost-monitor controls, validates clean source and returns new bindings. Canonical score/claim graphs stay unchanged; the diagram shows review dependencies because this static review produced no comparable measurements.
