Source qualification: admission withheld

GOAL-ISOU-f30a07 · DEC-20261016-5cf723 · TASK-20261016-d73a0b

Frozen source015 — independent qualification, zero scientific trials

Semantics / identity: holds

Six exact A/B math pairs

Resource joint: inconclusive

Missing retained015 interruption

Source admission withheld

New logging-only supplement

Observation

Independent review TASK06cc13 holds exact reference semantics and identity, and leaves resource/build/custody/default policy inconclusive. Frozen native source015fa7bb504ef63953e0e04e464bb266f4f207bf remains distinct from merged3ce. Report165128 bytes / SHA256 b4a06acd8c86e21578a34110c4c03e628d85195d2eb04d67b2f6166afcb01be8 is unchanged. No scientific run was executed.

Six complete A/B mathematical JSON pairs match exactly, with no field exclusions and20 recorded transports per record.118 external Git objects, four compiled/installed executable pairs and11 logical custody names over10 content objects match. Unit stdout records a passing interruption test, but its temporary trace/control root was not retained by the015 clean runner. The source-identical older e82 trace remains historical evidence.

Comparison and inference

The frozen plan required raw interrupted execution evidence bound to frozen source/executable invocation. Passing unit stdout plus an older trace leaves that link open. Source admission is withheld; decision revise. A new bounded existing interruption unit test in each observed arm, with fresh absolute retained roots and full invocation bindings, is the next engineering action. This creates new evidence rather than recovering historical bytes. No arithmetic, benchmark, target replay, source/default change or retry is authorized.

Limitations

Current complete3ce root suite remains FAIL:4161 passed,1 failed,117 ignored, exit101. A later14-test filtered pass (4265 filtered) is separate and does not establish cause. Earlier failures and historical passes are preserved. Required PR/CI gates remain binding. Client bytes/readbacks match but its source/build is not independently established. LF repair/local controls do not establish Windows-native post-repair success.

Lean proves integer scalar and finite-convolution statements; the broader inverse/reversal/Rust argument remains written source/control reasoning. IDC1 is a finite evaluated supplement. Actual reviewer model/effort is unknown; native review requested xhigh with separate low capability floor, no provider substitution. No EV/KN, performance, worldwide record or security promotion is warranted.

Next action and record

Executor TASK7b4402: exactly one existing pure-trace interruption test per reference/candidate unit executable, prospective hashes and retained parent/child logs, then new snapshot and independent supplemental review before a fresh source gate. Goal remains active. Expanded P19250341 replay stays primary; secondary compact bounds remain held. Existing scientific graphs and frontier records were checked and remain unchanged.

Full signed report, source-first note, attestation, inventory, source-admission record and exact archive bindings are beside this report under next-native-source-20261016. Pre-review main ledger baseline349 errors is preserved without checker/baseline changes; final comparison is recorded separately.
