Complete P29 checkpointed base transport

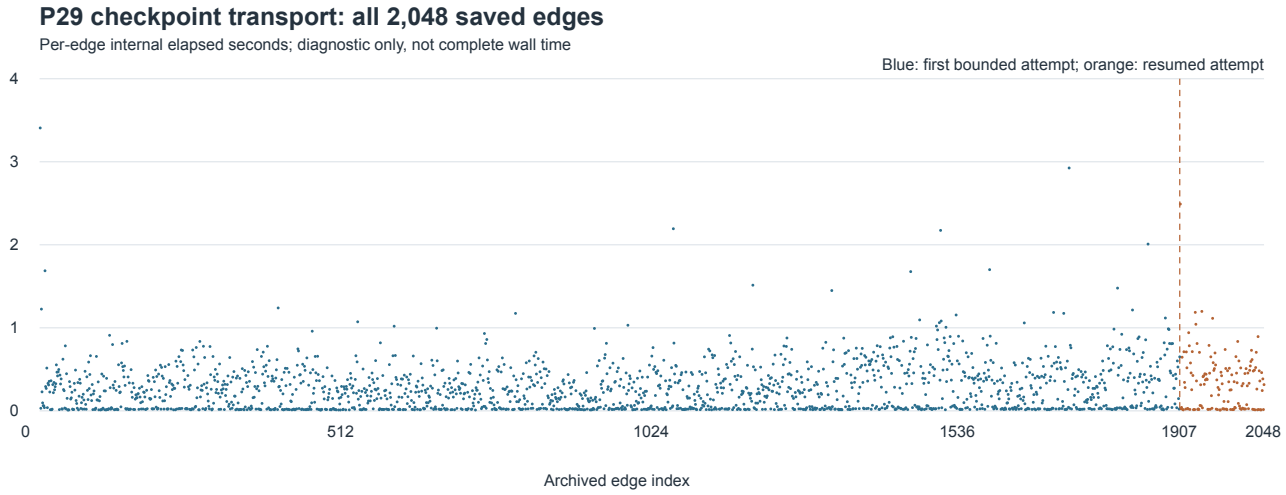

16 October 2026 | Conductor T-3394 | implementation observation

This report records the fixed P29 source `low_x` base carried through the archived 2,048-edge degree-7 walk. It makes no relation-yield, rank, ECDLP-cost, or hypothesis-status decision. The complete commands, raw logs, source hashes and limitations are in `report.md`.

Bounded attempts

Phase	Last edge	Process status	Independent replay
First continuation	1,907	540 s watchdog	1,907 edges, 976,384 point images
Second continuation	2,048	exit 0	2,048 edges, 1,048,576 point images

The first process stopped at its watchdog without a partial checkpoint. The independently verified prefix bound a second attempt, which reached the prescribed endpoint. The final independent hash and point-map replay passed with terminal checkpoint SHA-256 `39d17f4eff4bd408f86b59c6a5cbf10980d99b3ddd5f4c3680c9e4b3607737f3`.

Resource record and boundary

The second continuation recorded 82.18 s wall, 7.25 s user+system CPU, and 249,167,872 B maximum RSS. The full verifier recorded 42.44 s wall, 7.55 s user+system CPU, and 80,494,592 B maximum RSS. The first forced stop did not leave native resource totals. Per-edge times in the chart are internal diagnostics, not complete wall time. P37′s remaining path, the committed discovery target stream, native-base yield, rank, same-point solving and matched rho remain open.
