Matched four-channel binary m8 formula inputs

17 October 2026 · same targets and circuit for a weighted base and local random control

Question. Can the 316-column random control use the weighted candidate's exact 11-bit, four-channel XCNF formulation?

Frozen inputs. Four new gzip formulas, 2,774,964 bytes. Both arms have 316 projected columns, 632 accepted raw values, 454 primary variables and 11,328 membership clauses per file. Their seven-equation gate counts match in every channel: 88,444 / 88,293 / 88,445 / 88,294.

Checks. Independent serialized parsing checks hashes, target constants, gate definitions and every membership truth-table value. Twelve direct field evaluations check the 427 equation bits, three assignments per channel.

Boundary. No control file supplies a satisfying assignment. No solver degree or time, relation yield, rank, full index-calculus cost or speed advantage has been measured. Point signs, poles and exceptional cases still need full-point certification.

Records. `research/icperf_binary_torsion_k11_local_control_xcnf_20261017/manifest.json` and `verification.json`.
