Zero-run implementation archive complete

2026-10-25 UTC · GOAL-NISTSEED-ab8949

Named cohort orders executed: 0. The Coordinator accepted the declared static/mock implementation gate. The final V9 capture has nine methods, zero failures/errors and zero original-call attempts. The source-task completion release binds all six implementation files.

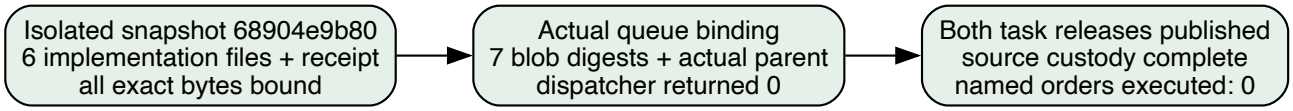

Figure 1: Actual source custody. These are administrative observations.

Exact isolated snapshot

Commit 68904e9b80c21785f1b17e6dfdb0e01b7aaf5a04 changes exactly six implementation files and its precommit receipt. Its actual parent is 2786a4b7da61427725c66805d2ff7cb1f377e6b0; fetched main is ab0609ebee3d17527a51667591bda56f7cdece31. All six file digests match the accepted package.

CORR-20261024-e1dbc8 resolves the receipt self-reference. The isolated receipt records actual source hashes and parent; subsequent queue metadata binds the actual snapshot commit and all seven blob digests, including that receipt. The later postcommit verification records actual Git checks without predicting a later tool result.

Actual verification and releases

The dispatcher call on committed queue metadata at 2bd93ca9861b1c3e1a6009077bae3ea7b5077cdc returned 0, ready 0/deferred 0. Dispatcher-verification.json separately records the command, timestamps, checked head and queue hash. Both task releases are published. The archive release is in ee16cabb8fe976f52774afb4464d21418789c8f5.

What follows

Implementation source custody is complete. The separate scientific protocol, real non-cohort repeatability control, actual preapproval/approval and ready-state verification remain ahead. There is no named-order ECPP outcome or shared curve property in this archive. Original-caller evidence remains absent.

The canonical admission diagram and SVG were updated together. Mathematical weakness and ECDLP frontier graphs remain unchanged. The earlier final-v9 PDF retains its historical cutoff; this addendum supplies the later custody state. The canonical-store S3 403 publication blocker is separate from the successful Git archive.

Evidence: source-bindings.json beside this PDF binds the exact archive receipts, actual dispatcher verification, both task releases and queue metadata. All cited evidence is internal and retrieved. Editable diagram: status.dot. Rendering: status.svg.
