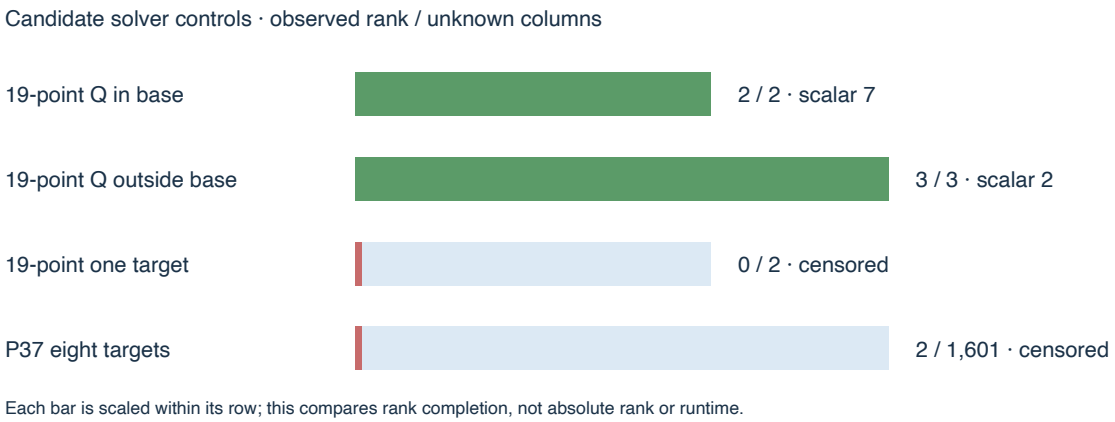
Candidate complete-solve path: bounded controls

2026-10-22. The current source was exercised on three public 19-point inputs and one eight-target P37 prepared input. The two full-rank 19-point cases recovered scalars 7 and 2; separate Sage point checks passed. The one-target 19-point input and the P37 input remained rank-censored.



The P37 wrapper finished four independently checked phases under 8 GiB and 1,800 seconds. The solver saw rank 2 of 1,601 unknown columns. This tests large-field parsing and matrix layout on eight public targets. It does not establish full-quota rank, a completed P37 solve, an ECDLP time, or a rho comparison. Commands, hashes, logs and resource receipts are retained in the control directories and summarized in report.md.
