Native resource and trace retake

GOAL-ISOU-f30a07 / TASK-20261016-ed10a6 / archive TASK-20261016-9b1e68

Published e82 → predeclared independent source retake

RSS state/control definitions + trace/core/public boundary: hold in scope

Clean installed binary + new custody → later protocol freeze and /run

Scope and observation

The independent reviewer inspected published sourcee82d80feaf under a plan committed and pushed at7e8d8bcf0e before dispatch. All13 manifest hashes matched. Compact norm/point modules are byte-identical to reviewed9a2 source. The reviewer read no new raw controls or PASS summaries and executed no tests, binaries, benchmarks or targets. Actual served model/effort remain unknown.

Review outcome

All three joints hold at static source/test-definition scope: normal public resource monitoring and acknowledgement; negative None/zero control definitions before/after acknowledgement; and trace behavior with unchanged acceptance. The reviewer explicitly corrects the earlier missed post-ack zero-RSS condition. The repair removes that exception. Definitions exercise actual child supervision with clearly synthetic telemetry, withholding before release and termination after loss.

Meaning of trace evidence

Requested trace errors fail explicitly; fresh output uses create_new and flushed JSONL records. A hard kill may leave a partial final line, so only complete parseable records in the retained prefix establish evidence. An unfinished begin is not a completed cost. Core COMPLETED only means replay returned: later worker-row, resource, season, source, degree and map bindings remain mandatory for public ACCEPTED. The trace excludes parent preflight/snapshot and child document validation before replay, so it is not full-process accounting.

Pending gates and sequence

Local clean executable SHA b3cbd6ac5d457a0f6d6398d1fcefc408f627e60be52c81c9009406486b61587b was independently hashed; version namese82 and dirtyfalse. This is separate from independent source review and remote custody. Commands remain unapproved pending new clean-control/custody receipts and official protocol/archive bindings. Rank same-map50341 profiling first, then compactM8191 construct and independent verify, concurrency1. Preserve every censor/failure. No speed ratio, record, expanded-map admission or prescribed-execution-proof claim follows. Canonical claim/score graphs stay unchanged; this diagram shows evidence dependencies because the review produced no scientific measurements.
