F6 second pass: prepared, not executed

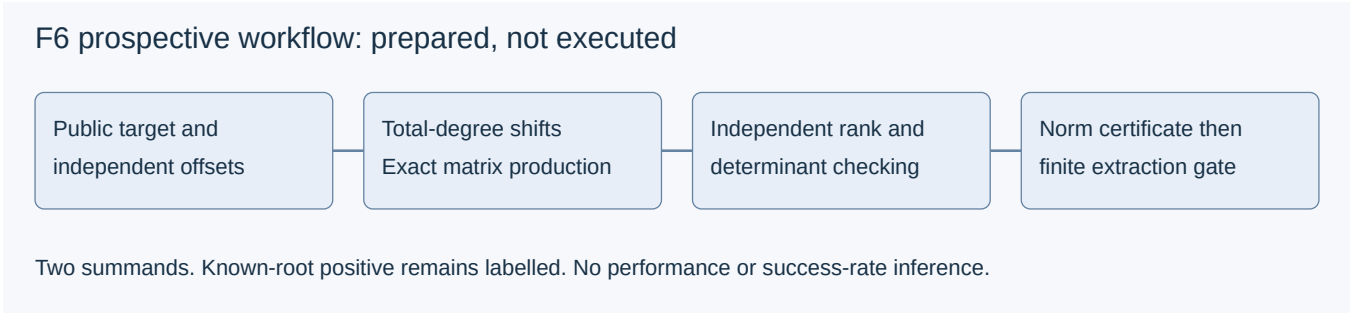

Figure 1: Editable study diagram; exact scope and evidence paths appear in the report.

The task is TASK-20261026-2746d0. Source preparation follows the committed Phase A card. The runner will screen twelve total-degree staircase families at five fixed widths, inspect a root-independent public-target 8-by-8 box, and reduce two fixed small matrices, including a labelled known-root control.

No second-pass observation is claimed here. Execution requires root's exact frozen protocol/source release and a successful real S3 checkpoint gate. The source accepts --help without collecting data. protocol.draft.json is prospective and must not be presented as a frozen preregistration.

After release, run run.py --out runs/run-01 --seed 2026102606, then analysis.py --run runs/run-01 --out reports/run-01, and export the same run using export.py --run runs/run-01 --protocol protocol.json --out export.json. Commands are run from this track directory with the released interpreter.
