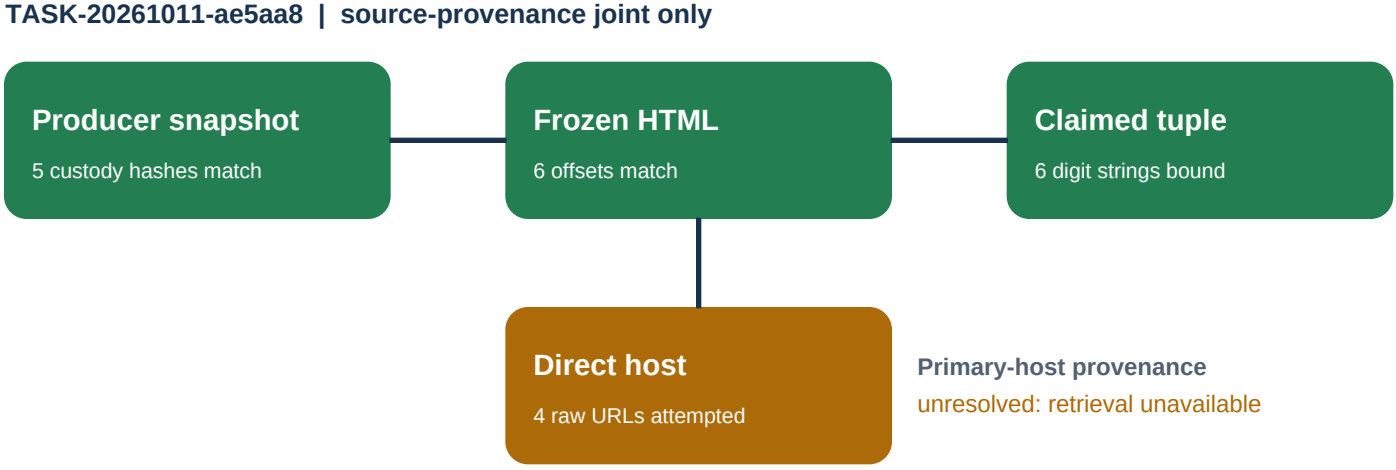
SCURVE L5 J1 | independent source-provenance review

Task TASK-20261011-ae5aa8 | 2026-10-11T17:25:38.019806+00:00

Joint verdict: INCONCLUSIVE

The frozen source custody and six integer offsets agree, but this session did not reproduce all four direct-host byte streams.



Observation

The snapshot receipt hashes match the source-binding YAML and four frozen HTML files. Each of p, a, b, x1, y1, and l occurs at its recorded zero-based byte offset and one-based line; its digit string matches the plan tuple.

Independent route

Four HTTPS URLs on safecurves.cr.yp.to were attempted through Python urllib with proxies disabled and default TLS verification. The run-specific URL, time, response/failure, byte length, SHA-256, and offsets are retained in replay.stdout.txt and review-report.yaml.

Inference and limit

The producer's primary_host_direct label remains an unverified producer statement. C-1 remains unresolved; network failure is not mathematical evidence.

This joint assesses source binding only. It supplies no arithmetic, transfer, attack-cost, SafeCurves criterion, or curve-safety verdict.

Source and output pointers

Frozen receipt: TASK-20261011-071e47/snapshot-receipt.json; producer source-binding: TASK-20261001-762c5f/source-binding.yaml; full replay output and exact offsets: this task's replay.stdout.txt and review-report.yaml.
