P37 source-base transport: check vertex 24

Observation-only report, 2026-10-21. This control checks saved map and base arithmetic; no relation targets were collected.

Inputs

P37 over $F_{81640512137}$, prime group order 81640511861, 1,600 x-orbits (3,200 signed points). Archived walk SHA-256: `523686cad4acf24d6c54dc73e25c9527fcd6337912643053674ca5b87129d281` . Sage 10.10.rc0.

Observations

The successful producer wrote edges 22–24 with timers 1.600, 1.162 and 1.261 s. Edge 24 has $j = 27040562305$; checkpoint SHA-256: `ed74a5492453944588f3365e483cc28a634e39bf5be6b5ca48006ae2f751b93a` . Producer wall 11.43 s; verifier wall 1.99 s. Independent replay: status pass, 24 edges and 76,800 point images; terminal hash matches checkpoint. A first launch failed on a missing sparse-checkout input before writing any checkpoint, and its logs are retained.

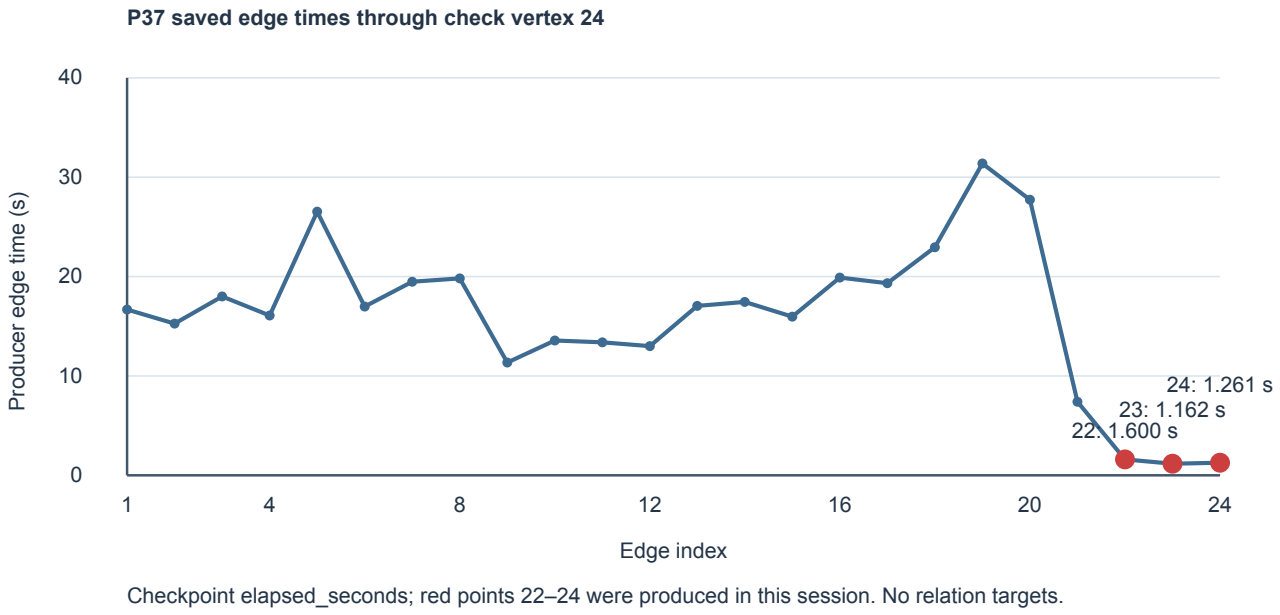

Figure 1: Checkpoint-recorded edge times. Edges 22–24 were produced in this session; edges 1–21 are earlier controls.

Scope

The verifier independently checks the saved edge and full signed-base map chain. Edges 25–256 and all relation-yield, rank, and ECDLP measurements remain open. Exact commands, logs, model identity, and source script are in the accompanying Markdown report.
